Farm safety

Get your home ready for cooler weather

Heating season will be here before you know it. Here are six ways to keep your energy use in check as the weather gets cooler.

- Check for gaps in your walls around windows, doors and holes in exterior walls where cords and cables enter the house. Cool air that leaks into the house through those gaps can compete with the warm air your heating system pumps. Keeping cool air outside where it belongs will mean your heating system doesn't have to work as hard to keep your family comfortable.
- Lower the temperature in your home. Even 2 degrees can make a difference in the amount of energy used without drastically impacting comfort.
- Install a programmable thermostat. Many thermostats have "eco" settings to help maximize energy savings.
- Reverse the direction that your ceiling fan blades spin. A clockwise movement pushes warm air back down into the room, which can make people in the room feel warmer.
- Replace or clean the filters in your heating and air

conditioning systems. A clogged filter blocks air from flowing through, which makes your HVAC system work harder and use more energy.

- Make an appointment with an HVAC service to inspect your heating system and repair any problems before it gets really cold outside. Spending a little on maintenance now could head off a more costly problem later.

Do you have an electric vehicle?

Let us know!

As your electric co-op we are looking for ways to better serve your needs.
